# Cadmium and Cadmium Compounds (Cadmium)

## Chemical Information

**General Uses:** Cadmium is used in metal plating and to make pigments, batteries and plastics. It is obtained as a byproduct from melting zinc, lead, or copper ores.

## How Much Cadmium Was Generated?

For 2007, 53 facilities reported generating approximately 816,000 pounds of cadmium. Two facilities reported approximately 68 percent of the national total quantity of this PC; eight facilities reported approximately 90 percent (please refer to Exhibit 3.4 to see the number of facilities that reported this PC within various quantity ranges). Compared to the total quantities of cadmium reported for 2005 and 2006, the quantity increased by approximately 256,000 pounds and decreased 52,000 pounds, respectively (Exhibit 4.1).

**Exhibit 4.1. National Generation of Cadmium (2005–2007)**

TRI Reporting Year	2005	2006	2007
Total Quantity of Cadmium (pounds)	611,375	867,700	815,688
Number of TRI Facilities Reporting Cadmium	65	62	53

## Where Was Cadmium Generated?

For 2007, two facilities reported a total of approximately 558,000 pounds of cadmium, representing approximately 68 percent of the total quantity generated (Exhibit 4.2). One facility, an inorganic chemical manufacturing facility, located in Caribou County, Idaho (EPA Region 10), reported an increase of approximately 238,000 pounds for 2006. This facility's cadmium is an impurity in phosphate ores from which nodules are made for use in electric arc furnaces for the production of 99 percent pure phosphorous. The quantity of this facility's reported cadmium is determined by the concentration of cadmium in the ore and the production rate. The second facility, a secondary smelting and refining facility, located in Washington County, Oklahoma (EPA Region 6), extracts lead and zinc from electric arc furnace dusts. This facility's quantity of cadmium correlates to the variability of the electric arc furnace dusts processed.

## Which Industries Generated Cadmium?

For 2007, nine facilities in two NAICS codes reported approximately 78 percent of the cadmium generated (Exhibit 4.3). Two of these facilities, one each in NAICS code 325188 (All other basic inorganic chemical manufacturing) and in NAICS code 331492 (Secondary smelting, refining, and alloying of nonferrous metal (except copper and aluminum) reported approximately 68 percent of the national total quantity of cadmium generated for 2007.

## How Did Facilities Manage Cadmium?

Exhibit 4.4 shows how facilities, by industry, managed cadmium in 2007.

**Disposal:** Facilities disposed of 100 percent of the cadmium generated with approximately an equal amount disposed of on site and off site.

**Energy Recovery:** Energy recovery is not applicable to this PC.

**Treatment:** No facilities reported treating this PC.

In 2007, facilities also recycled approximately 597,000 pounds of cadmium. See Exhibit C.3 in Appendix C for additional information about the recycling of cadmium. Facilities also released 5,300 pounds of cadmium as air emissions and surface water discharges in 2007. See Appendix D for additional information about releases of cadmium.

## Data Derived From Hazardous Waste Biennial Reports for Cadmium

In this section, we present data about cadmium contained in hazardous wastes, derived from information submitted by facilities in Biennial Reports under RCRA. We derived these data by applying a methodology to estimate the quantity of cadmium contained in BR waste streams. The estimates of cadmium contained in hazardous wastes supplement the data reported to TRI, providing a broader perspective regarding the industries that generate and manage wastes that contain cadmium. Based on applying our methodology to the 2007 BR data, we estimate that 4,379 facilities in 472 NAICS codes reported hazardous wastes containing approximately 2.2 million pounds of cadmium. Waste streams classified as non-wastewaters contained approximately 99 percent of the cadmium. Facilities in NAICS code 331110 (Iron and Steel Mills and Ferroalloy Manufacturing) accounted for approximately 83 percent of the total estimated quantity of cadmium in the hazardous waste streams (Exhibit 4.5).

Exhibit 4.7 shows how facilities reported managing hazardous wastes that contain cadmium. For example, facilities used metals recovery for hazardous wastes containing an estimated 744,000 pounds of cadmium; hazardous wastes containing an estimated 550,000 pounds of cadmium were disposed of in landfills or surface impoundments. See Appendix E for a full list of the BR management codes and their descriptions.
